Template

Customer experience journey map

Use this framework to better understand customer needs, motivations, and obstacles by illustrating a key scenario or process from start to finish. When possible, use this map to document and summarize interviews and observations with real people rather than relying on your hunches or assumptions.

Share template feedback

What do people experience as they begin the process?

SCENARIO

Browsing, booking, attending, and rating a local city tour

Entice

How does someone initially become aware of this process?

Learner Blending Specific experience with the other

Enter

Engage

In the core moments in the process, what happens?

Exit

What do people typically experience as the process finishes?

Extend

What happens after the experience is over?

Steps

What does the person (or group) typically experience?

- After seeing they first promotion about wildfire detection system, the potential prospects to exercise
- **Through website or app**
- After that (may fill in the credit card information and phone, or
- If the customer qo, want to buy the product (GPS, thermal camera)
- Customer qo a certain number than they qo a lot of successfully information
- Operating first and identity where it started
- fast and accurate
- Automatic and efficient
- After getting the product they get the information, product review, ordered
- After receiving the product by the customer they will write review about the product. The customer will rate the product
- Leave the product behind (if it is rent)
- Recommendation to other

Interactions

What interactions do they have at each step along the way?

- **People:** Who do they see or talk to?
- **Places:** Where are they?
- **Things:** What digital touchpoints or physical objects would they use?

- web camera
- forest office
- fire detection
- Interaction with video frame camera for collecting image
- identify the forest
- detect forest fire
-
- accurately detect fire occurrence
- real time vedioab panaramic image
- after detect forest fire forest fire will be extinguished

Goals & motivations

At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")

- Fire Remove
- Superb visualization find perceptible and identical APP
- Easy to use
- Open it up or spotlight neutral (no left
- customer feel good the product its qo out (no detection and no fast welcome
- Fire suppression mechanism and near-vicinity after continuous computation and analysis of the data to locate among the people
-
- It plays a role in locating numerous fires that ground team cannot see from the ear during tours
- Share by countersinking the fire-fighting cost and extended lifecycl

Positive moments

What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?

- ie
- It control the spare time
- our patented technology accurately determine fire location
- work reliably in tough environment
- energy efficient
- the major factor that influence the fire growth and fuel arrangement ceiling height ,length/width ratio ,twist-inspiration size and location of burning floating ,ventilation air ,weather operation
-
- perfectly
- high precision visual detection
- taking multiple shot simultaneously to identify smoke
- They kill harmful insect
- they clear away diseased trees
- they make way for new trees
- the ashes hold nutrients to the soil
- see three people too there recommendation system, and the system detecting high risk

Negative moments

What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?

- no matter care wild fire still require
- tey component to operate (thermal camera) fuel fuel and oxygen there component, ceiling is
- they require additional manpower to operate the system
- ada fire can about compression communication system, and power and water supply
- they only lead to a deterioration of the air quality and loss of biodiversity, which poisons animals and people
- human carcinogenic is the biggest factor contribution to wildfire
-
- the detection system has many limitation
- complexity of ML algorithm or when executing on sensor nodes
- limited amount of energy required
- limited computation
- short range of communication

Areas of opportunity

How might we make each step better? What ideas do we have? What have others suggested?

- LWIR detection is fast
- unmanned aerio vehicles
- high resolution static camera fixed on the ground
- detection ignition more quicky
- wildfire detection system
- drones-based detection system
- helpful for future use
